

CONCISE WEEK 6 PROJECT SUMMARY

Week 6 – Advanced Analytics & Decision Support

This week, I progressed from exploratory data analysis to advanced analytics and decision support using the HealthConnect dataset.

I validated key Week 5 KPIs and conducted deeper analysis of previous no-show behaviour, reminder effectiveness, appointment type, distance to clinic and booking lead time. I also reviewed the Week 5 gender finding and introduced a preliminary risk-segmentation approach to identify appointments potentially at higher risk of no-show.

The analysis identified previous no-show behaviour, distance to clinic and booking lead time as important areas requiring further investigation, while reminder channels showed differences in observed no-show rates. These findings were translated into practical recommendations focused on targeted reminders, enhanced engagement for high-risk patients and improved accessibility.

The Power BI dashboard was also improved from the Week 5 descriptive dashboard into a **No-Show Risk & Decision Support** view.
